### Encoding test specifications

► Def. 1

- A trace  $\sigma$  satisfies a test specification  $M$  if  $\sigma$  contains at least one linearization of  $M$  as a **contiguous** subsequence.
- Given MSC  $M$ ,
  - define  $\text{Lin}(M)$  = set of linearizations of  $M$ .
  - For each linearization  $\sigma = e_1, e_2, \dots, e_k$  define
    - Define  $\text{prop}_\sigma = F(e_1 \wedge X(e_2 \wedge X(\dots X(e_k) \dots)))$
  - Define property  $\varphi_M$  corresponding to  $M$  as
    - $\varphi_M = \neg (\vee_{\sigma \in \text{Lin}(M)} \text{prop}_\sigma)$
- A counter-example to  $\varphi_M$  is a test satisfying  $M$ .

4

Copyright 2009 by Abhik Roychoudhury

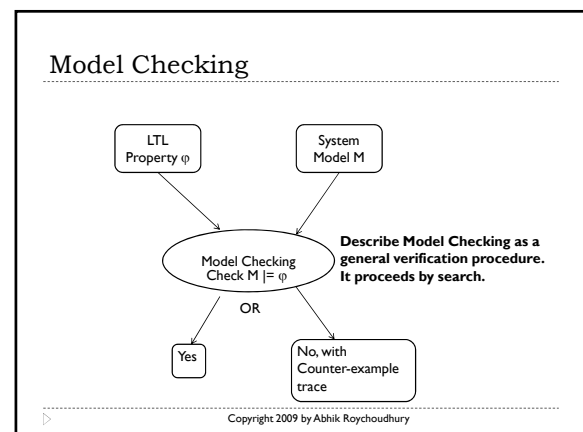

### Encoding test specifications

► Def. 2

- A trace  $\sigma$  satisfies a test specification  $M$  if  $\sigma$  contains at least one linearization of  $M$  as a subsequence.
- Given MSC  $M$ ,
  - define  $\text{Lin}(M)$  = set of linearizations of  $M$ .
  - For each linearization  $\sigma = e_1, e_2, \dots, e_k$  define
    - $n_\sigma = \neg (e_1 \vee e_2 \vee \dots \vee e_k)$
    - $\text{prop}_\sigma = (n_\sigma \mathbf{U} (e_1 \wedge X(n_\sigma \mathbf{U} (e_2 \wedge X(\dots X(n_\sigma \mathbf{U} e_k) \dots))))$
  - Define property  $\varphi_M$  corresponding to  $M$  as
    - $\varphi_M = \neg (\vee_{\sigma \in \text{Lin}(M)} \text{prop}_\sigma)$
- A counter-example to  $\varphi_M$  is a test satisfying  $M$ .

5

### LTL Model Checking – does $M \models \varphi$

1. Consider  $\neg\varphi$ . None of the exec. traces of  $M$  should satisfy  $\neg\varphi$ .
2. Construct a finite-state automata  $A_{\neg\varphi}$  such that
  - $\text{Language}(A_{\neg\varphi}) = \text{Traces satisfying } \neg\varphi$
3. Construct the synch product  $M \times A_{\neg\varphi}$
4. Check whether any exec trace  $\sigma$  of  $M$  is an exec trace of the product  $M \times A_{\neg\varphi}$  i.e. check  $\text{Language}(M \times A_{\neg\varphi}) = \text{empty-set?}$ 
  - Yes: Violation of  $\varphi$  found, report counterexample  $\sigma$
  - No: Property  $\varphi$  holds for all exec traces of  $M$ .

Copyright 2009 by Abhik Roychoudhury

### Recap: finite-state automata

- ▶  $A = (Q, \Sigma, Q_0, \rightarrow, F)$ 
  - ▶  $Q$  is a finite set of states
  - ▶  $\Sigma$  is a finite alphabet
  - ▶  $Q_0 \subseteq Q$  is the set of initial states
  - ▶  $\rightarrow \subseteq Q \times \Sigma \times Q$  is the transition relation
  - ▶  $F \subseteq Q$  is the set of final states.
- ▶ What is the Language of such an automaton?

Copyright 2009 by Abhik Roychoudhury

### Recap: finite-state automata

- ▶ Regular languages:
  - ▶ Accept any finite-length string  $\sigma \in \Sigma^*$  which ends in a final state.
- ▶  $\omega$ -regular languages:
  - ▶ Accept any infinite-length string  $\sigma \in \Sigma^\omega$  which visits a final state infinitely many times.
- ▶ Set of strings accepted = *Language* of the automata.

Copyright 2009 by Abhik Roychoudhury

### Finite automata

- ▶ Meaning as a regular language
  - ▶  $(a+b)^*b^+$
  - ▶ All finite length strings ending with  $b$
- ▶ Meaning as a  $\omega$ -regular language
  - ▶ All infinite length strings with finitely many  $a$

Copyright 2009 by Abhik Roychoudhury

### LTL properties to automata

- ▶ Given a LTL property  $p$ 
  - ▶ we want to convert  $p$  to an automata  $A_p$  s.t.
  - ▶  $\text{Language}(A_p) = \text{strings / traces satisfying } p$
- ▶ LTL properties are checked over infinite traces.
  - ▶ Given an infinite trace  $\sigma$  and a LTL property  $p$ , we can check whether  $\sigma \models p$
- ▶ To convert LTL properties to finite-state automata, consider automata accepting inf.-length traces.
  - ▶  $\text{Language}(A_p)$  is  $\omega$ -regular, not regular.

Copyright 2009 by Abhik Roychoudhury

### LTL properties to automata

- ▶ Given a LTL property  $\varphi$ 
  - ▶ We convert it to a  $\omega$ -regular automata  $A_\varphi$
- ▶  $\text{Language}(A_\varphi) = \{\sigma \mid \sigma \in \Sigma^\omega \wedge \sigma \models \varphi\}$ 
  - ▶  $\text{Language}(A_\varphi)$  is defined as per the  $\omega$ -regular notion of string acceptance. It accepts inf. length strings.
  - ▶ All infinite length strings satisfying  $\varphi$  form the language of  $A_\varphi$
  - ▶ Whether an infinite length string satisfies  $\varphi$  (or not) is defined as per LTL semantics.

Copyright 2009 by Abhik Roychoudhury

### Example: LTL property to automata

Copyright 2009 by Abhik Roychoudhury

### Recall: LTL Model Checking

1. Consider  $\neg\phi$ . None of the exec. traces of  $M$  should satisfy  $\neg\phi$ .
2. Construct a finite-state automata  $A_{\neg\phi}$  such that
  - $\text{Language}(A_{\neg\phi}) = \text{Traces satisfying } \neg\phi$
3. Construct the synch product  $M \times A_{\neg\phi}$
4. Check whether any exec trace  $\sigma$  of  $M$  is an exec trace of the product  $M \times A_{\neg\phi}$  i.e. check  $\text{Language}(M \times A_{\neg\phi}) = \text{empty-set?}$ 
  - Yes: Violation of  $\phi$  found, report counterexample  $\sigma$
  - No: Property  $\phi$  holds for all exec traces of  $M$ .

Copyright 2009 by Abhik Roychoudhury

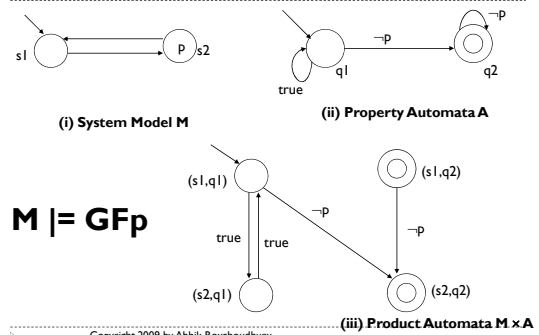

### Example: Verify GFp

- Construct negation of the property
  - $\neg\text{GF}p \equiv \text{FG}\neg p$
- Construct automata accepting infinite length traces satisfying  $\text{FG}\neg p$

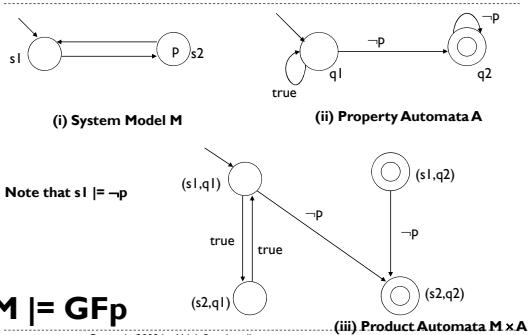

Copyright 2009 by Abhik Roychoudhury

### Product Automata

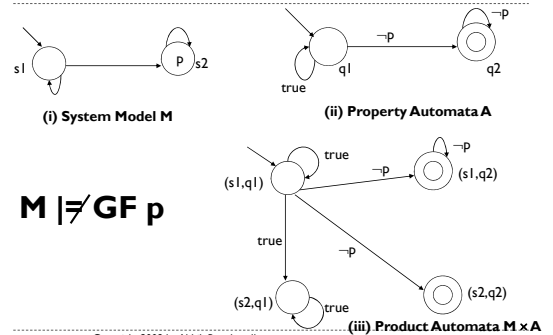

Copyright 2009 by Abhik Roychoudhury

### Product Automata Construction

Copyright 2009 by Abhik Roychoudhury

### Product Automata

Copyright 2009 by Abhik Roychoudhury

### Recall: LTL Model Checking

1. Consider  $\neg\varphi$ . None of the exec. traces of  $M$  should satisfy  $\neg\varphi$ .
2. Construct a finite-state automata  $A_{\neg\varphi}$  such that
  - $\text{Language}(A_{\neg\varphi}) = \text{Traces satisfying } \neg\varphi$
3. Construct the synch product  $M \times A_{\neg\varphi}$
4. Check whether any exec trace  $\sigma$  of  $M$  is an exec trace of the product  $M \times A_{\neg\varphi}$  i.e. check  $\text{Language}(M \times A_{\neg\varphi}) = \text{empty-set?}$ 
  - Yes: Violation of  $\varphi$  found, report counterexample  $\sigma$
  - No: Property  $\varphi$  holds for all exec traces of  $M$ .

Copyright 2009 by Abhik Roychoudhury

### Emptiness Check

- ▶  $\text{Language}(M \times A_{\neg\varphi}) = \text{empty-set?}$ 
  - ▶ Is there any trace which visits one of the accepting states of the product automata infinitely many times?
  - ▶ Look for accepting cycles.

Copyright 2009 by Abhik Roychoudhury

### Emptiness Check

- ▶ Perform DFS from initial state until you reach an accepting state  $s_{acc}$
- ▶ When you reach  $s_{acc}$ , remember  $s_{acc}$  in a global var. and start a nested DFS from  $s_{acc}$ 
  - ▶ Stop the nested DFS if you can reach  $s_{acc}$
- ▶ If no accepting cycles are found, report yes.
- ▶ If accepting cycles are found
  - ▶ Concatenate the two DFS stacks and report it as counterexample trace of the LTL property.
- ▶ This algo. is implemented in SPIN model checker.

Copyright 2009 by Abhik Roychoudhury

Copyright 2009 by Abhik Roychoudhury

### Nested DFS – step 1

- ▶ procedure  $\text{dfs1}(s)$ 
  - ▶ push  $s$  to  $\text{Stack1}$
  - ▶ add  $\{s\}$  to  $\text{States1}$
  - ▶ if  $\text{accepting}(s)$  then
    - ▶  $\text{States2} := \text{empty}; \text{seed} := s; \text{dfs2}(s)$
  - ▶ endif
  - ▶ for each transition  $s \rightarrow s'$  do
    - ▶ if  $s' \notin \text{States1}$  then  $\text{dfs1}(s')$
  - ▶ endfor
  - ▶ pop  $s$  from  $\text{Stack1}$
- ▶ end

Copyright 2009 by Abhik Roychoudhury

### Nested DFS – step 2

- ▶ procedure  $\text{dfs2}(s)$ 
  - ▶ push  $s$  to  $\text{Stack2}$
  - ▶ add  $\{s\}$  to  $\text{States2}$
  - ▶ for each transition  $s \rightarrow s'$  do
    - ▶ if  $s' = \text{seed}$  then report acceptance cycle
    - ▶ else if  $s' \notin \text{States2}$  then  $\text{dfs2}(s')$
  - ▶ endif
  - ▶ endfor
  - ▶ pop  $s$  from  $\text{Stack2}$
- ▶ end

Copyright 2009 by Abhik Roychoudhury

## Organization

- ▶ So Far
  - ▶ What is a Model?
  - ▶ ATC – Running Example
  - ▶ How to model such requirements
  - ▶ How to validate the models
    - ▶ Simulations,
    - ▶ Model-based testing,
    - ▶ Model Checking
    - ▶ Model Checkers
      - SPIN

▶

Copyright 2009 by Abhik Roychoudhury

## SPIN

- ▶ A tool for modeling complex concurrent and distributed systems.
- ▶ Provides:
  - ▶ Promela, a protocol meta language
  - ▶ A model checker
  - ▶ A random simulator for system simulation
  - ▶ Promela models can be automatically generated from a safe subset of C.

▶ 26

Copyright 2009 by Abhik Roychoudhury

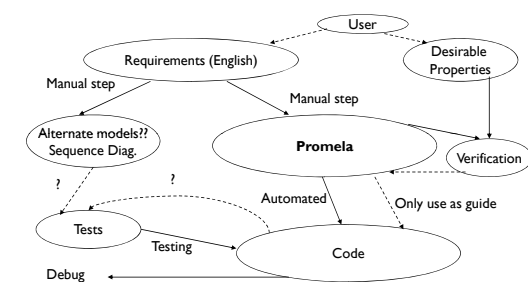

## Our Usage

- ▶ Learn Promela, a low-level modeling language.
- ▶ Use it to model simple concurrent system protocols and interactions.
- ▶ Gain experience in verifying such concurrent software using the SPIN model checker.
- ▶ Gives a feel (at a small scale)
  - ▶ What are hard-to-find errors ?
  - ▶ How to find the bug in the code, once model checking has produced a counter-example ?

▶ 27

Copyright 2009 by Abhik Roychoudhury

## Our Usage

▶ 28

Copyright 2009 by Abhik Roychoudhury

## Features of Promela

- ▶ Concurrency
  - ▶ Multiple processes in a system description.
- ▶ Asynchronous Composition
  - ▶ At any point one of the processes active.
  - ▶ Interleaving semantics
- ▶ Communication
  - ▶ Shared variables
  - ▶ Message passing
    - ▶ Handshake (synchronous message passing)
    - ▶ Buffers (asynchronous message passing)

▶ 29

Copyright 2009 by Abhik Roychoudhury

## Features of Promela

- ▶ Within a process
  - ▶ Non-determinism : supports the situation where all details of a process may not be captured in Promela model.
  - ▶ Standard C-like syntax
    - ▶ Assignment
    - ▶ Switch statement
    - ▶ While loop
    - ▶ Guarded command
      - Guard and body may not be evaluated together; that is, atomically.

▶ 30

Copyright 2009 by Abhik Roychoudhury

## Example

```

byte state = 0;

proctype A()
{
  byte tmp;

  (state==0) -> tmp = state;
  tmp = tmp+1;
  state = tmp;
}

init { run A(); run A(); }

```

We need to define how processes are scheduled.

31

Copyright 2009 by Abhik Roychoudhury

## SPIN's process scheduling

- ▶ All processes execute concurrently
- ▶ Interleaving semantics
  - ▶ At each time step, only one of the "active" processes will execute (non-deterministic choice here)
  - ▶ A process is active, if it has been created, and its "next" statement is not blocked.
  - ▶ Each statement in each process executed atomically.
  - ▶ Within the chosen process, if several statements are enabled, one of them executed non-deterministically.
  - ▶ We have not seen such an example yet !

32

Copyright 2009 by Abhik Roychoudhury

## Will this loop terminate?

Non-determinism within a single process.

```

byte count;

proctype counter()
{
  do
    :: count = count + 1
    :: count = count - 1
    :: (count == 0) -> break
  od;
}

```

Enumerate the reasons for non-termination in this example

▶

CS5219 2010-11 by Abhik

## This loop will not terminate

```

active proctype TrafficLightController() {
  byte color = green;
  do
    :: (color == green) -> color = yellow;
    :: (color == yellow) -> color = red;
    :: (color == red) -> color = green;
  od;
}

```

▶

CS5219 2010-11 by Abhik

## Channels

- ▶ SPIN processes can communicate by exchanging messages across channels
  - ▶ Apart from communication via shared variables.
- ▶ Channels are typed.
- ▶ Any channel is a FIFO buffer.
- ▶ Handshakes supported when buffer is null.
- ▶ chan ch = [2] of bit;
  - ▶ A buffer of length 2, each element is a bit.
- ▶ Array of channels also possible.
  - ▶ Talking to diff. processes via dedicated channels.

▶

CS5219 2010-11 by Abhik

## Example with channels

chan data, ack = [1] of bit;

```

proctype node1() {
  do
    :: data!1;
    :: ack?1;
  od;
}

init { atomic {
  run node1(); run node2();
} }

```

36

Copyright 2009 by Abhik Roychoudhury

### Example with channels

chan data, ack = [1] of bit;

```
proctype node1() {
  do
    :: data!;
    :: ack?;
  od
}
```

```
proctype node2() {
  do
    :: ack!;
    :: data?;
  od
}
```

```
init{ atomic{
  run node1(); run node2();
}}
```

▷ 37

Copyright 2009 by Abhik Roychoudhury

### SPIN Execution Semantics

- ▶ Select an enabled transition of any thread, and execute it.
- ▶ A transition corresponds to one statement in a thread.
  - ▶ Handshakes must be executed together.
    - ▶  $\text{chan } x = [0] \text{ of } \{ \dots \};$
    - ▶  $x!l \quad \parallel \quad x?data$

▷ 38

Copyright 2009 by Abhik Roychoudhury

### SPIN Execution Engine

```
while ((E = executable(s)) != {})
  for some (p,t) ∈ E
    { s' = apply(t.effect,s); /* execute the chosen statement */
    if (handshake == 0)
      { s = s';
        p.curstate = t.target;
      }
    else{ ...
```

▷ 39

Copyright 2009 by Abhik Roychoudhury

### SPIN Execution Engine

```
/* try to complete the handshake */
E' = executable(s'); /* E' = {} ⇒ s unchanged */
for some (p',t') ∈ E'
  { s = apply(t'.effect,s');
    p.curstate = t.target;
    p'.curstate = t'.target;
  }
  handshake = 0
} /* else */
} /* for some (p,t) ∈ E */
} /* while ((E = executable(s)) ... */
while (stutter) { s = s }
```

▷ 40

Copyright 2009 by Abhik Roychoudhury

### Model Checking in SPIN

- ▶  $(P1 \parallel P2 \parallel P3) \models \phi$ 
  - ▶  $P1, P2, P3$  are Promela processes
  - ▶  $\phi$  is a LTL formula
- ▶ Construct a state machine via
  - ▶  $M$ , asynchronous composition of processes  $P1, P2, P3$
  - ▶  $A_{\neg\phi}$ , representing  $\neg\phi$
- ▶ Show that “language” of  $M \times A_{\neg\phi}$  is empty
  - ▶ No accepting cycles.
- ▶ All these steps have been studied by us !!

▷ 41

Copyright 2009 by Abhik Roychoudhury

### Specifying properties in SPIN

- ▶ Invariants
  - ▶ Local: via assert statement insertion
  - ▶ Global: assert statement in a monitor process
- ▶ Deadlocks
- ▶ Arbitrary Temporal Properties (entered by user)
  - ▶ SPIN is a LTL model checker.
  - ▶ LTL properties can be entered as input to the checker!
    - ▶ Shown in the lab hour of the last lecture!

▷ 42

Copyright 2009 by Abhik Roychoudhury

## Connect system & property in SPIN

### • System model

```

• int x = 100;
• active proctype A()
• {
  do
    :: x % 2 -> x = 3*x+1
  od
• }
• active proctype B()
• {
  do
    :: !(x%2) -> x = x/2
  od
• }

```

### • Property

```

• GF (x = 1)
• Insert into code
• #define q (x == 1)
• Now try to verify GF q

```

▷ 43

Copyright 2009 by Abhik Roychoudhury

## More Involved Example

### ► Alternating Bit Protocol

- Reliable channel communication between sender and receiver.
- Exchanging msg and ack.
- Channels are lossy
- Attach a bit with each msg/ack.
- Proceed with next message if the received bit matches your expectation.

▷

CS5219 2010-11 by Abhik

## ABP Architecture

Implemented as SPIN processes

▷

CS5219 2010-11 by Abhik

## Sender & Receiver code

- chan datachan = [2] of { bit };
- chan ackchan = [2] of { bit };

```

active proctype Sender()
{
  bit out, in;
  do
    :: datachan!out ->
      ackchan?in;
    if
      :: in == out -> out = 1 - out;
    :: else fi
  od
}

```

```

active proctype Receiver()
{
  bit in;
  do
    :: datachan?in -> ackchan!in
  od
}

```

▷

CS5219 2010-11 by Abhik

## Timeouts

### ► Special feature of the language

- Time independent feature.
  - Do not specify a time as if you are programming.
- True if and only if there are no executable statements in any of the currently active processes.
- True modeling of deadlocks in concurrent systems (and the resultant recovery).

▷

CS5219 2010-11 by Abhik

## Model Checking in SPIN

### ► SPIN performs model checking by Nested DFS

- Discussed in the past lecture !!
- Find acceptance states reachable from initial states (DFS).
- Find all such acceptance states which are reachable from itself (DFS).
- Counter-example evidence (if any) obtained by simply concatenating the two DFS stacks.

▷ 48

Copyright 2009 by Abhik Roychoudhury

### Exercise – Model Checking – (1)

Two Computer Engineering students are taking the CS427/I exam. We must ensure that they cannot leave the exam hall at the same time. To prevent this, each student reads a shared token  $n$  before leaving the hall. The shared token is an arbitrary natural number. The global state of the system is given by  $s1, s2, n$  where  $s1$  and  $s2$  are the local states of students 1 and 2 respectively. Note that  $s1 \in \{in, out\}, s2 \in \{in, out\}$ . The pseudo-code executed by the two students are:

```

do forever{
  if s1 = in and n is odd
    { s1 := out }
  else if s1 = out
    { s1 := in; n := 3*n+1 }
  else { do nothing }
}

do forever{
  if s2 = in and n is even
    { s2 := out }
  else if s2 = out and n is even
    { s2 := in; n := n/2 }
  else { do nothing }
}

```

The two student processes are executed asynchronously. Every time one process is scheduled, it atomically executes one iteration of its loop. The above system is an infinite state system. Design a finite state abstraction and draw the global automata for the abstracted system. Your abstraction should be refined enough to prove mutual exclusion. Initially  $s1 = in$  and  $s2 = in$ .

▶ 50

Copyright 2009 by Abhik Roychoudhury

### Exercise – Model checking – (2)

- ▶ Consider the mutual exclusion property.
- ▶ Using the LTL model checking algorithm discussed in class, follow a step process to check the correctness of the property on the example given in the previous slide.

▶ 51
