Statecharts

Abhik Roychoudhury
School of Computing
National University of Singapore

4/6/2011

CS4271, 2011

1

Background

- Finite state machines
 - Other variants
 - Model Reactive and transformational systems
- Statecharts is one of the simplest and most popular modeling formalism
 - Very intuitive, visual.
 - An illustration of how to model systems with statecharts will be shown via Rhapsody tool.
 - Also, tested in the first lab assignment.

4/6/2011

CS4271, 2011

2

Readings

- Statecharts: A visual formalism for complex systems, by David Harel, Science of Computer Programming, 1987
- Executable object modeling with statecharts, by David Harel and Eran Gery, IEEE Computer, 1997
- Basic understanding of states/transitions is introduced first.

4/6/2011

CS4271, 2011

3

Introducing FSMs --- a puzzle

- A man with a goat, a wolf and a cabbage wants to cross a river.
- A boat can carry only 2 of the 4 entities.
- Wolf wants to eat the goat.
- Goat wants to eat the cabbage.
 - How to transport all the 4 entities ?
- Think of modeling the local state of each entity – on which side of the river?
 - A global state is a composition of these local states --- transitions of global states form FSM

4/6/2011

CS4271, 2011

4

State change

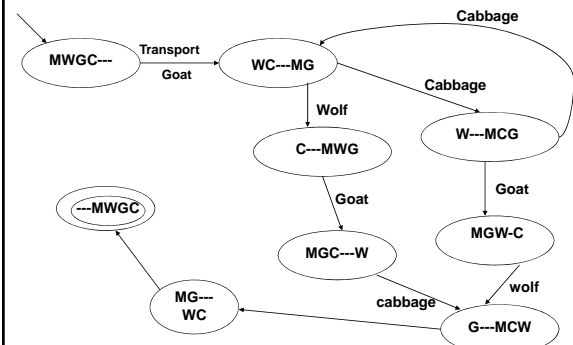

4/6/2011

CS4271, 2011

5

State change

4/6/2011

CS4271, 2011

6

Modeling using FSMs

- A solution to our problem is a path from the initial state to a state where all 4 entities are on other side of river.
 - Notion of "termination" of the problem.
 - Shown as accepting states of FSMs
- Minor note:
 - Not all cycles in the FSM for this problem have been shown.

4/6/2011

CS4271, 2011

7

FSM --- Definition

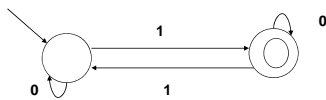

- $M = (S, S_0, \Sigma, \rightarrow, F)$
 - S is a set of states
 - $S_0 \subseteq S$ is the set of initial states
 - $\rightarrow \subseteq S \times \Sigma \times S$ is the transition relation
 - $F \subseteq S$ is the set of final or accepting states
- The set of strings accepted by M or the language of M
 - $L(M)$ = all strings which have a path from an initial state to an accepting state.
 - Using finite state machines for recognizing or distinguishing (infinite) set of (finite) strings.

4/6/2011

CS4271, 2011

8

FSM --- Example

Accepts all binary strings with odd number of 1s
An infinite collection of finite strings

4/6/2011

CS4271, 2011

9

Transition Systems

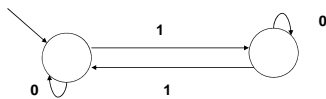

- FSMs can accept infinite strings too, change accepting condition
 - An infinite string is accepted iff it visits at least one final state infinitely often.
- Transition systems go one step further where all states are accepting.
 - $TS = (S, S_0, \Sigma, \rightarrow)$
 - No notion of terminating or accepting states
 - The alphabet Σ labeling the transitions is also optional.
 - The traces captured by a transition system are obtained by unrolling the graph from the initial state(s).

4/6/2011

CS4271, 2011

10

TS - Example

Traces captured by this transition system are
 $(0^*1)^*0^*$
 $(0^*1)^*$

4/6/2011

CS4271, 2011

11

Transformational Systems

- Conventional notion of a terminating program.
 - Takes in input.
 - Performs computation step.
 - Terminates after producing output.
- System behavior
 - Can be described as a transformation function over the input.
- What about controllers ?
 - In continuous interaction with the environment.

4/6/2011

CS4271, 2011

12

Reactive Systems

- Continuously interacts with its environment.
 - No notion of system termination.
- Interaction with environment is typically asynchronous.
- Often consists of a concurrent composition of processes.
 - Often, its response to environment needs to obey time constraints.

4/6/2011

CS4271, 2011

13

Reactive system behavior

- (Infinite) collection of infinite traces.
- Traces denote ongoing interaction with environment.
- Use state transition systems to describe behavior of a reactive system
 - Too much complexity
 - Many processes --- concurrency
 - Each process has many states --- hierarchy
 - What kind of inter-process communication?
- The language of Statecharts addresses these practical issues !!

4/6/2011

CS4271, 2011

14

Visual Formalisms

- Important/imperative at initial design stages.
- Vital for communication.
- Formal visual languages can help in:
 - Documentation
 - Initial analysis.
 - Developing correct-by-construction translation to more detailed (non-visual) descriptions.

4/6/2011

CS4271, 2011

15

Statecharts

- Statecharts =
 - FSMs +
 - Depth +
 - Orthogonality +
 - Structured transitions +
 - Broadcast communication
- Used in the Rhapsody tool.
- Included in UML 2.0 as state diagrams.

4/6/2011

CS4271, 2011

16

Statecharts

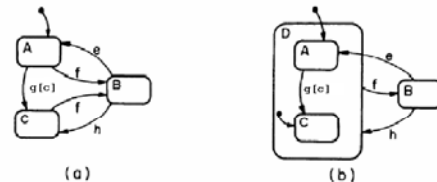

- Depth:
 - States can have internal structure.
 - OR type states
- Orthogonality
 - Independent states
 - Concurrency
 - AND type states
- Structured transitions
 - Succinct descriptions of transition families.
- Broadcast communication
 - Succinct descriptions of synchronizations

4/6/2011

CS4271, 2011

17

Depth : OR States

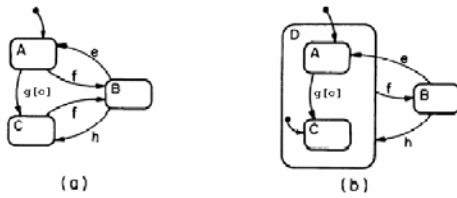

(b) is the statechart representation of the FSM (a).

4/6/2011

CS4271, 2011

18

Depth : OR States

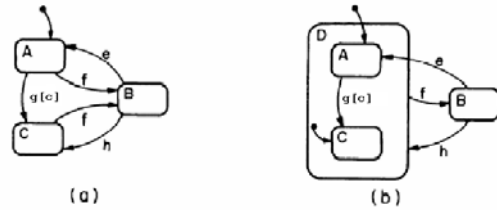

A and C are clustered into a superstate D
A and C are the internal exclusive-or components of the D state.

4/6/2011

CS4271, 2011

19

Depth : OR States

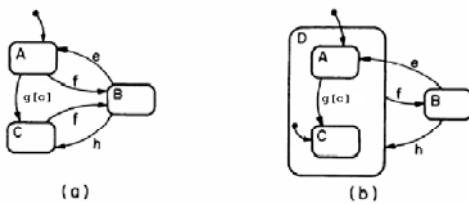

e, f : are trigger (external) events.
g [c]: g, a trigger event and c a condition

4/6/2011

CS4271, 2011

20

Depth : OR States

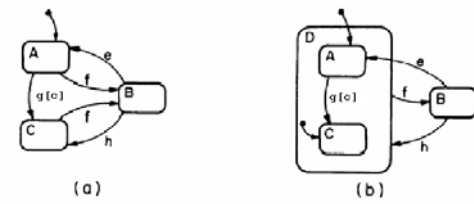

f is a transition from D to B.
From any D-state (A or C) there is an f-move to B

4/6/2011

CS4271, 2011

21

Depth : OR States

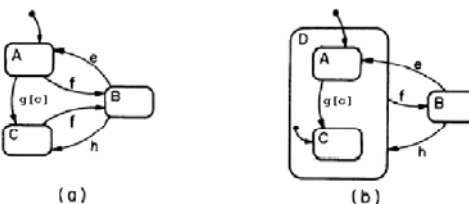

h is transition from B to D (A or C).
The actual state entered is the default entry state; the state C

4/6/2011

CS4271, 2011

22

Depth : OR States

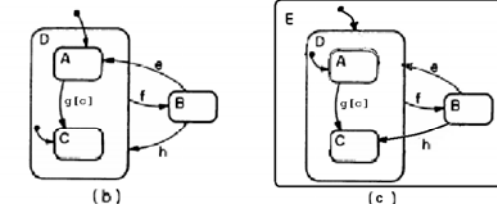

D is the initial state.
The actual initial state within D is not the default state C.
Instead, it is A.

4/6/2011

CS4271, 2011

23

Depth: OR States

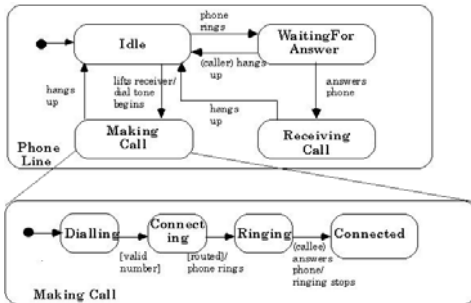

Which state will transition e yield in (b) and (c)?
Which state will transition h yield in (b) and (c)?
What's the default state for the superstate E in (c)? Hierarchically!

4/6/2011

CS4271, 2011

24

A Concrete Example: OR-chart

4/6/2011

CS4271, 2011

25

OR-State: in a nutshell

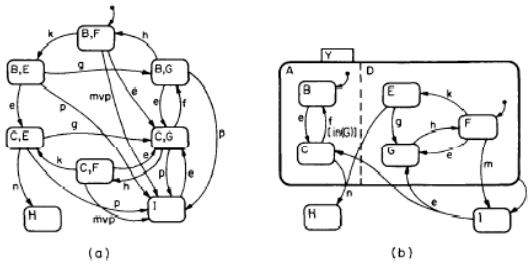

- An OR-state can contain other states as its internal substates (hierarchical internal structure);
- A super OR-state is active, if and only if one of its immediate substates is active (exclusive or);
- When the control enters a (super) OR-state, its default substate is entered and becomes active;
- When the control leaves a (super) OR-state, all its substates become inactive!
- More issues: history, priority, ...

4/6/2011

CS4271, 2011

26

Orthogonality: AND States

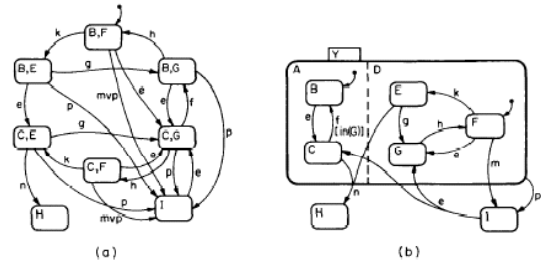

(b) is the statechart representation of the FSM (a).

4/6/2011

CS4271, 2011

27

Orthogonality: AND States

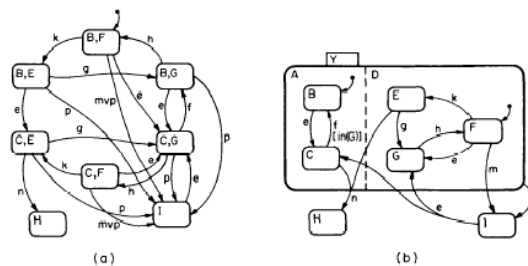

Y is an AND state.
It has two orthogonal components A and D.
A is an OR state with components B and C.
D is an OR state with components E, F and G.

4/6/2011

CS4271, 2011

28

Orthogonality: AND States

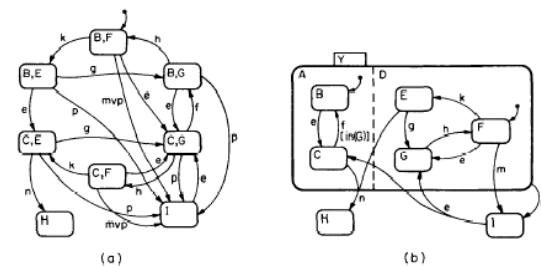

Y is an AND state.
It has two orthogonal components A and D.
a state of Y is composed of a state of A and a state of D
What is the default initial state of Y?

4/6/2011

CS4271, 2011

29

Orthogonality: AND States

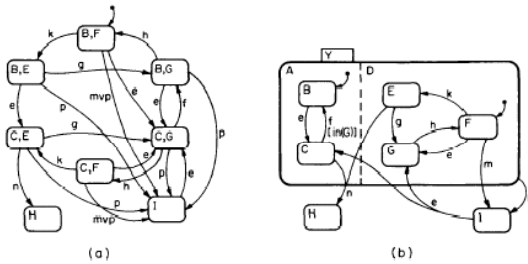

Y is an AND state.
It has two orthogonal components A and D.
a state of Y is composed of a state of A and a state of D
What is the default initial state of Y? (B,F)

4/6/2011

CS4271, 2011

30

Orthogonality: AND States

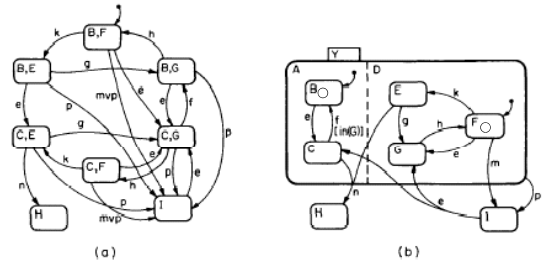

(a)
f belongs to only A.
e belongs to both A and D.
From (B,F) there is a simultaneous e-move to (C,G)

4/6/2011

CS4271, 2011

31

Orthogonality: AND States

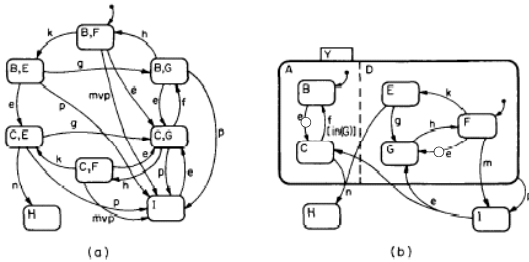

(a)
f belongs to only A.
e belongs to both A and D.
From (B,F) there is a simultaneous e-move to (C,G)

4/6/2011

CS4271, 2011

32

Orthogonality: AND States

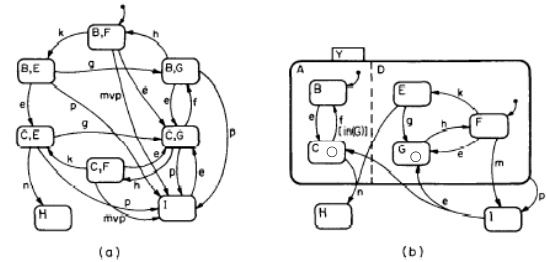

(a)
f belongs to only A.
e belongs to both A and D.
From (B,F) there is a simultaneous e-move to (C,G)

4/6/2011

CS4271, 2011

33

Orthogonality: AND States

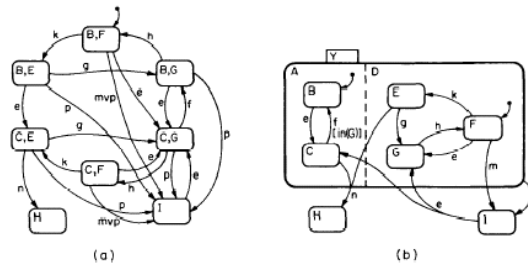

(a)
f belongs to only A.
e belongs to both A and D.
From (B,F) there is a simultaneous e-move to (C,G)

4/6/2011

CS4271, 2011

34

Orthogonality: AND States

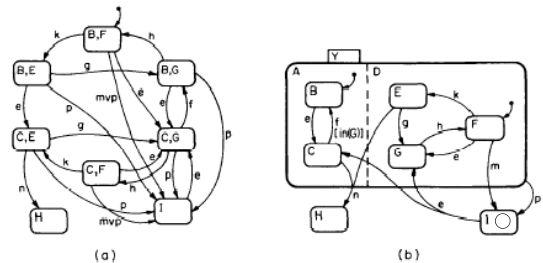

(a)
From every Y state (how many ?) there is a p-move to I

4/6/2011

CS4271, 2011

35

Orthogonality: AND States

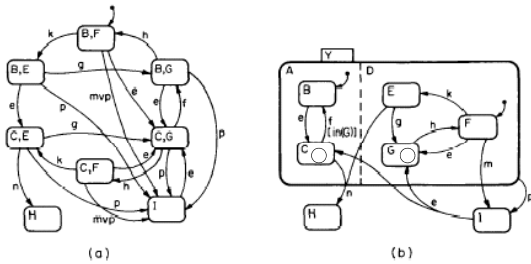

(a)
From every Y state (6!) there is a p-move to I
From I there is an e-move to the Y-state (? , ?)

4/6/2011

CS4271, 2011

36

Orthogonality: AND States

From I there is an e-move to the Y-state (C, G)

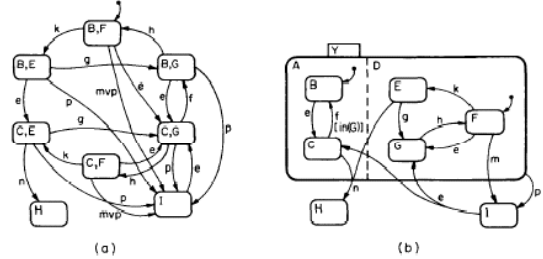

What if there is an e-arrow from I to just the surface of Y?

4/6/2011

CS4271, 2011

37

Orthogonality: AND States

For each (? , F) state there is an m-move to I
Note the [in G] condition attached to the f-move from C (state reference!).

4/6/2011

CS4271, 2011

38

AND-state: in a nutshell

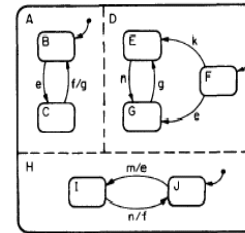

- An AND-state is composed of several independent (OR-)states that run in parallel (concurrency);
- An *active state* of an AND-state comprises a state of each concurrent component, i.e., (s_1, s_2, \dots, s_n) ;
- When the control enters (leaves) an AND-state, it simultaneously enters (leaves) all its components;
- An AND-state can even occur inside an OR-state (different from conventional programming languages)

4/6/2011

CS4271, 2011

39

Broadcast Communication

A transition has a trigger and an action (output!)

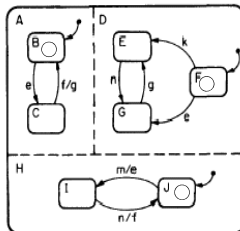

But the output of a transition can be inputs for other orthogonal components!

4/6/2011

CS4271, 2011

40

Broadcast Communication

Start configuration (B, F, J)

m/e: m is the trigger event, while e is the action (output!)

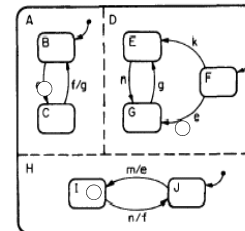

Suppose m (external event) occurs.

4/6/2011

CS4271, 2011

41

Broadcast Communication

Start configuration (B, F, J)

Suppose m (external event) occurs.

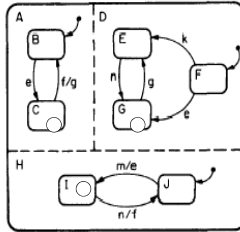

H goes to I from J ; e-moves are enabled in A and D

4/6/2011

CS4271, 2011

42

Broadcast Communication

Start configuration (B, F, J)

m occurs

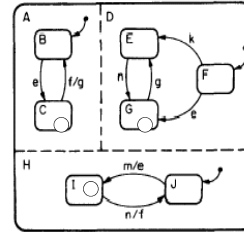

Final configuration (C, G, I)

4/6/2011

CS4271, 2011

43

Broadcast Communication

Suppose event n comes,

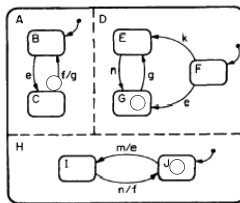

What happen now?

4/6/2011

CS4271, 2011

44

Broadcast Communication

Now suppose event n comes,

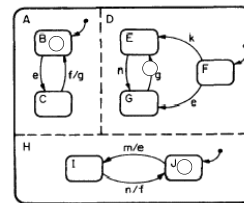

What happen? Transition $I \xrightarrow{n/f} J$ is fired, f is generated, which fires transition $C \xrightarrow{f/g} B$

4/6/2011

CS4271, 2011

45

Broadcast Communication

Now suppose event n comes,

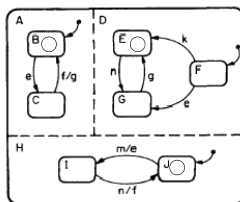

What happen? Transition $I \xrightarrow{n/f} J$ is fired, f is generated, which fires transition $C \xrightarrow{f/g} B$, which again fires $G \xrightarrow{g} E$

4/6/2011

CS4271, 2011

46

Broadcast Communication

Now suppose event n comes,

Transition $I \xrightarrow{n/f} J$ is fired, f is generated, which fires transition $C \xrightarrow{f/g} B$, which again fires $G \xrightarrow{g} E$ Finally yielding (B,E,J)

4/6/2011

CS4271, 2011

47

What are the triggers/actions

- Method call
 - Method_name(parameters)
- Or, Event
 - Event_name(parameters)
- Is there a difference?
 - Lots, in terms of semantics
 - A method call involves a transfer of control
 - If there are nested method calls, they can cause further transfer of control
 - An event will be lodged in a system queue
 - It will be removed by the recipient later.

4/6/2011

CS4271, 2011

48

Events and Method calls

- Event based communication
 - Inherently asynchronous
 - Designer does not worry about controlling all interaction sequences (this is taken care of by the system queue)
- Method call based communication
 - Synchronous, involving transfer of control
 - Involves close control by the designer over interaction sequences ---
 - getting closer to code level

4/6/2011

CS4271, 2011

49

Most General form of ...

- ... annotation for a transition
 - Trigger[condition]/Action
- Trigger is event expression or method invocation
- Condition is like a branch condition on data variables
- Action is a program
 - Sequence of event generation or method invocation or even code in a programming language.

4/6/2011

CS4271, 2011

50

Summary

- Practical Use of Statecharts in Modeling Object-based systems
 - Use statecharts to describe behavior of classes (of active objects)
 - Class Associations given by class diagrams.
 - Contains code in the actions for realistic designs
- A realistic approach for modeling (distributed) embedded controllers.

4/6/2011

CS4271, 2011
