

From Code to Models

Abhik Roychoudhury
National University of Singapore

IISc Summer Course 2007 by
Abhik Roychoudhury

Recap on Model Checking

- Inputs:
 - A finite state transition system M
 - A "temporal" property φ
- Check $M \models \varphi$
- Output
 - True if $M \models \varphi$
 - Counter-example evidence, otherwise

IISc Summer Course 2007 by
Abhik Roychoudhury

Model Checking for SW Verif.

- The steps:
 - Generate transition system-like models from code
 - Typically involves at least data abstractions
 - Exhaustive search through the model
 - For time/space efficiency, the model may not be explicitly represented and searched.
 - Explaining counter-examples
 - Hot topic of research

IISc Summer Course 2007 by
Abhik Roychoudhury

More on the big picture

- Explaining counter-example
 - Counter-example points to an actual violation of property φ in program.
 - How to locate the bug from the counter-example – SW Engineering activity
 - It was introduced owing to the abstractions
 - Refine the abstraction and run model checking on the model derived by refined abstraction
 - Abstract \rightarrow Model Check \rightarrow Refine loop.

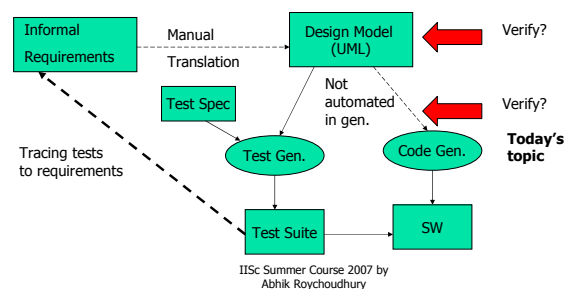

IISc Summer Course 2007 by
Abhik Roychoudhury

An issue not to gloss over ...

- ... in the software dev. Process
 - Model checking applied to
 - Software Requirements
 - Formalize design, express in input language of a model checker (e.g. SPIN), verify
 - Software
 - Post-mortem extraction of models from SW implementation, verify.

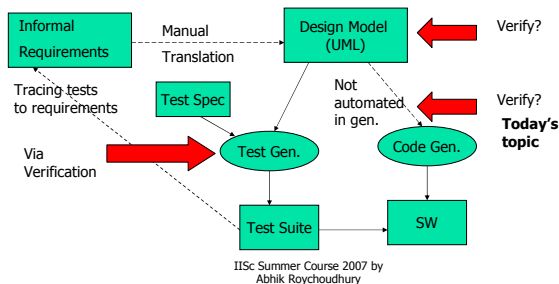

IISc Summer Course 2007 by
Abhik Roychoudhury

SE process

IISc Summer Course 2007 by
Abhik Roychoudhury

More on the SE process

The approach (1)

- Reasoning techniques over finite-state models well-understood.
 - Search based procedures (Model Checking)
- Need to generate models from code
 - Typically finitely many control locations
 - Infinitely many data states (memory store)
- How to abstract the memory store?
 - This can give a finite state model

IISc Summer Course 2007 by Abhik Roychoudhury

The approach (2)

- Boolean abstraction used on memory store
 - State of memory captured by finitely many boolean variables which answer queries about its contents
- Check all possible behaviors of a program
 - Translate program to a finite state model and employ model checking
 - Modify the state space search algorithm in model checking to directly verify programs
 - E.g. Verisoft checker from Bell Labs

IISc Summer Course 2007 by Abhik Roychoudhury

Model Generation Projects

- Source Language → Modeling Language
- E.g. C → PROMELA (FesVer tool)
- C → Boolean Pgm (SLAM toolkit)
- Various choices in Bandera toolkit
- In this lecture, we consider a
 - source language with sequential programs
 - Properties are locational invariants
 - $G((pc = 34) \Rightarrow (v = 0))$

IISc Summer Course 2007 by Abhik Roychoudhury

Restrictions

- Modeling languages typically do not support
 - Dynamic heap allocation/ de-allocation
 - Call Stack of Procedure Activation Records
- Restriction relaxed in SLAM toolkit
 - Allows for models with procedures
 - Memory allocation?
 - As we go on ...

IISc Summer Course 2007 by Abhik Roychoudhury

Predicate Abstraction

- Input
 - Source Program P
 - S_p , Set of Predicates about variables in P
- Output
 - Abstracted program P1
 - Data states in P1 correspond to valuations of predicates in S_p

IISc Summer Course 2007 by Abhik Roychoudhury

Predicate Abs. (once more)

- Input :
 - A C program P1
 - A set of predicates containing vars of P1
- Output
 - A boolean program P2
 - Only data type of P2 is "boolean"
 - P2 contains more execution paths than P1 i.e.
 - All paths of P1 are captured in P2, not vice-versa
 - P2 is being used for invariant verification of P1.

IISc Summer Course 2007 by
Abhik Roychoudhury

The Language of Predicates

- Boolean expressions containing program variables,
 - No function calls
 - Pointer referencing is allowed
 - $P \rightarrow \text{val} > \text{Var}$
 - Of course Bool. Exp contains
 - $B = B \wedge B \mid B \vee B \mid \neg B \mid A \text{ Relop } A$
 - $A = A + A \mid A - A \mid A * A \mid A / A \mid \text{Var}$
 - Relop = $< \mid > \mid \leq \mid \geq \mid \neq \mid =$

IISc Summer Course 2007 by
Abhik Roychoudhury

Simple Examples

- | | |
|--|--|
| <ul style="list-style-type: none"> ■ Source Code ■ Var := 0
 ■ Var := Var1 | <ul style="list-style-type: none"> ■ Abstracted Code ■ [Var = 0] := true ■ [Var = 1] := false
 ■ [Var = 0] := unknown ■ (no preds. about Var1) ■ OR- ■ [Var = 0] := [Var1 = 0] ■ (Var1=0 is another pred) |
|--|--|

IISc Summer Course 2007 by
Abhik Roychoudhury

Control constructs

- Abstraction scheme will be developed for
 - Within a procedure
 - Assignments
 - Branches
 - All other constructs can be represented by these
 - Across procedures
 - Formal and actual parameters
 - Local variables
 - Return variables

IISc Summer Course 2007 by
Abhik Roychoudhury

Assignments to predicates

- We are converting a C program to a "boolean" program where the only type is boolean.
 - The boolean program will not be executed.
- Assignment to our predicate variables can assign
 - true / false / unknown
 - If "unknown" is assigned, both possibilities should be explored during model checking

IISc Summer Course 2007 by
Abhik Roychoudhury

Assignments

- Predicate abstraction of pgm. P w.r.t. $\{b_1, \dots, b_k\}$
- Effect of $X := e$ on b_1, \dots, b_k
- Variable b_i denotes expression φ_i
- If $\varphi_i[X \rightarrow e]$ holds before $X := e$ then set
 - $b_i := \text{true}$
- If $\neg \varphi_i[X \rightarrow e]$ holds before $X := e$ then set
 - $b_i := \text{false}$

IISc Summer Course 2007 by
Abhik Roychoudhury

Simple Ex. of Assignments

- $b1 \equiv X > 2$ $b2 \equiv Y > 2$
- Assignment $X := Y$
- Transform it to
 - $b1 := b2$
- $b1 \equiv X > 2$ $b2 \equiv Y > 2$ $b3 \equiv X < 3$ $b4 \equiv Y < 3$
- Transform $X := Y$ to the parallel assignment
 - $b1, b3 := b2, b4$

IISc Summer Course 2007 by
Abhik Roychoudhury

Assignments – (2)

- But $\varphi_i[x \rightarrow e]$ may not be representable as a boolean formula over b_1, \dots, b_k
- Examples:
 - Predicates: $X < 5, X = 2$
 - Assignment stmt: $X := X + 1$
 - $X < 5 [X \rightarrow X+1]$ equivalent to $X + 1 < 5$
equivalent to $X < 4$
 - $X = 2 [X \rightarrow X+1]$ equivalent to $X + 1 = 2$
equivalent to $X = 1$

IISc Summer Course 2007 by
Abhik Roychoudhury

Assignments – (3)

- Define predicate $b1$ as $X < 5$
- $b2$ as $X = 2$
- What is the weakest formula over $b1$ and $b2$ which implies $X < 4$?
- If this formula is true, we can conclude
 - $X < 4$ before $X := X + 1$ is executed
 - $X < 5$ after $X := X + 1$ is executed
 - $b1 = \text{true}$ after $X := X + 1$ is executed.

IISc Summer Course 2007 by
Abhik Roychoudhury

Assignments - Summary

- Predicates: $\{b_1, \dots, b_k\}$
- Predicate b_i represents expression φ_i
- $X := e$ is an assignment statement in the pgm. being abstracted.
- We can conclude $b_i = \text{true}$ after $X := e$ iff $\varphi_i[x \rightarrow e]$ before $X := e$ is executed.

IISc Summer Course 2007 by
Abhik Roychoudhury

Assignments - Summary

- Find the weakest formula over b_1, \dots, b_k which implies $\varphi_i[x \rightarrow e]$ and check whether it is true before $X := e$
- If yes, set $b_i = \text{true}$ as an effect of $X := e$ in the abstracted program
- Set $b_i = \text{false}$ in the abstracted pgm if the weakest formula over b_1, \dots, b_k which implies $\neg \varphi_i[x \rightarrow e]$ holds
- If none of this is possible, $b_i = \text{unknown}$

IISc Summer Course 2007 by
Abhik Roychoudhury

Assignments - Example

- Predicates: $b1$ is $X < 5$, $b2$ is $X = 2$
- Assignment: $X := X + 1$
- Weakest pre-condition for $b1$ to hold, denoted as $WP(X := X+1, b1)$
 - $X < 4$
- Weakest formula over $\{b1, b2\}$ to imply $WP(X := X+1, b1)$, denoted as $F(WP(X := X+1, b1))$
 - $X = 2$, that is, the formula $b2$

IISc Summer Course 2007 by
Abhik Roychoudhury

Assignments Example

- Predicates: $b1$ is $X < 5$, $b2$ is $X = 2$
- $WP(X := X+1, \neg b1)$ equivalent to $X + 1 \geq 5$ equivalent to $X \geq 4$
- $F(WP(X := X+1, \neg b1)) = F(X \geq 4)$ is
 - $X \geq 5$, that is, the formula $\neg b1$ itself
- Computation of the F function is in general exponential, Why ??

IISc Summer Course 2007 by
Abhik Roychoudhury

Computation of $F(\phi)$

- Consider all minterms of $b1, \dots, b_k$
 - $\neg b1 \wedge \neg b2$
 - $\neg b1 \wedge b2$
 - $b1 \wedge \neg b2$
 - $b1 \wedge b2$
- Which of them imply ϕ ?
- Take the disjunction of all such minterms and simplify. Improvements to this algo. possible.

IISc Summer Course 2007 by
Abhik Roychoudhury

Exercise

- $b1 \equiv X < 5$, $b2 \equiv X = 2$
- Assignment in the program
 - $X := X + 1$
- What will it be substituted with in our "boolean" program ?
 - Let us do it now

IISc Summer Course 2007 by
Abhik Roychoudhury

Aliasing via pointers

- To compute the effect of $X := 3$ on $b1$
 - We compute $F(WP(X := 3, b1))$
 - Suppose $b1$ is $*p > 5$, p is a pointer
- Effect of $X := 3$ depends on whether
 - X and p are aliases
 - Use a "points-to" analysis to determine this.
 - Typically flow insensitive
 - Aliasing analysis sharpens information about program states and hence the abstraction.

IISc Summer Course 2007 by
Abhik Roychoudhury

Effect of aliasing

- $WP(X := 3, *p > 5)$ is
 - $(\&x = p \wedge 3 > 5) \vee (\&x \neq p \wedge *p > 5)$
- Thus, $WP(X := e, \phi(Y))$ is
 - $(\&X = \&Y \wedge \phi[Y \rightarrow e]) \vee (\&x \neq \&Y \wedge \phi(Y))$
 - If X and Y are aliases replace Y by e in ϕ
 - Otherwise, the assignment has no effect
- If ϕ refers to several locations, each of them may/may not alias to X .

IISc Summer Course 2007 by
Abhik Roychoudhury

Another exponential blowup

- If ϕ refers to k locations
 - Each may/not alias to X
 - 2^k possibilities
 - WP is a disjunction of 2^k minterms
- In practice, accurate static **not-points-to** analysis is feasible
 - Removes conjuncts corresponding to confirmed non-aliases (in any control loc.)

IISc Summer Course 2007 by
Abhik Roychoudhury

Control constructs

- Abstraction scheme will be developed for
 - Within a procedure
 - Assignments
 - Branches
 - All other constructs can be represented by these
 - Across procedures
 - Formal and actual parameters
 - Local variables
 - Return variables

IISc Summer Course 2007 by
Abhik Roychoudhury

Control branches

- So far, considered straight-line code.
- Consider the effect of conditional branch instructions as in **if-then-else** statements.
- **Loops** are conditional branch instructions with one branch executing a **goto**.
- Sufficient to consider
 - **Abstract(If (c) {S1} else {S2})**

IISc Summer Course 2007 by
Abhik Roychoudhury

Control Branches

- If (c) {S1} else {S2}
 - ↑↓
 - If (*) { assume (c) ; S1 } else { assume (¬c); S2 }
 - (*) denotes non-deterministic choice
 - **assume(φ)** terminates exec. if φ is false
 - Otherwise, the statement has no effect.

Different from the
assert statement

IISc Summer Course 2007 by
Abhik Roychoudhury

Abstracting Branches

- Abstract(If (c) {S1} else {S2}) is
 - If (*) { assume G(c); Abstract(S1) } else { assume G(¬c); Abstract(S2) }
 - Predicates: b_1, \dots, b_k
 - G(c) is the strongest formula over b_1, \dots, b_k which is implied by c
 - Formal definition in next slide.

IISc Summer Course 2007 by
Abhik Roychoudhury

Abstracting Branches

- $G(c) = \neg F(\neg c)$
 - Dual of the F operator studied earlier
- **CAUTION: G and F operators of this lecture different from LTL operators**
- Why choose the G operator for abstracting branches, why not F ?

IISc Summer Course 2007 by
Abhik Roychoudhury

Questions

- Abstract(if (c) {S1} else {S2})
 - ↑↓
 - If G(c) { Abstract(S1) } else { Abstract(S2) }
- Was the assume statement necessary
Does the assume statement introduce new paths ?

IISc Summer Course 2007 by
Abhik Roychoudhury

Abstracting Branches- Example

- If $(*p \leq x) \{ *p := x \} \text{ else } \{ *p := *p + x \}$
- Predicates
 - $b1$ is $*p \leq 0$
 - $b2$ is $x = 0$
- $G(*p \leq x) = \neg F(*p > x)$
- To compute $F(*p > x)$ consider all minterms of $b1$ and $b2$

IISc Summer Course 2007 by
Abhik Roychoudhury

Abstracting Branches- Example

- Minterms of $b1, b2$
 - $\neg b1 \wedge \neg b2$ is $*p > 0 \wedge x \neq 0$
 - $b1 \wedge \neg b2$ is $*p \leq 0 \wedge x \neq 0$
 - $\neg b1 \wedge b2$ is $*p > 0 \wedge x = 0$
 - $b1 \wedge b2$ is $*p \leq 0 \wedge x = 0$
- $F(*p > x) = \neg b1 \wedge b2$
 - $\&x$ and p are considered to be non-aliases

IISc Summer Course 2007 by
Abhik Roychoudhury

Abstracting Branches- Example

- $G(*p \leq x) = \neg F(*p > x) = \neg(b2 \wedge \neg b1) = \neg b2 \vee b1 = b2 \Rightarrow b1 = (x = 0) \Rightarrow (*p \leq 0)$
- Similarly compute $G(\neg(*p \leq x))$
- Abstracted template
 - If $(*) \{ \text{assume } (x = 0 \Rightarrow (*p \leq 0)); \dots \}$
 - else $\{ \text{assume } (x=0 \Rightarrow \neg(*p \leq 0)); \dots \}$

IISc Summer Course 2007 by
Abhik Roychoudhury

Control constructs

- Abstraction scheme will be developed for
 - Within a procedure
 - Assignments
 - Branches
 - All other constructs can be represented by these
 - Across procedures
 - Formal parameter, Local variables, Return variables
 - Procedure calls and returns

IISc Summer Course 2007 by
Abhik Roychoudhury

Inter-procedural Abstraction

- One-to-one mapping of procedure
 - Each proc. to an abstract one
 - No inlining introduced by abstraction.
- Given predicates: $b1, \dots, bk$
 - Each pred. is marked global (refers to global vars.) or local to a specific procedure.
 - Does not allow capturing relationships of variables across procedures. **Will Revisit this!**

IISc Summer Course 2007 by
Abhik Roychoudhury

Abstracted procedures ?

- Given
 - A concrete procedure R
 - A set E_R of predicates $b1, \dots, bj$ specific to R
 - E_R can refer to parameters of R
- Need to define an abstract procedure $R1$
 - Formal Parameters of $R1$
 - Local Vars. of $R1$
 - Return Vars. of $R1$

IISc Summer Course 2007 by
Abhik Roychoudhury

Example

```
int procedure(int* q, int y)
{
  int l1, l2;
  .....
  .....
  return l1;
}
```

Predicates:

b1 is $y \geq 0$
b2 is $*q \leq y$
b3 is $y = l1$
b4 is $y > l2$

IISc Summer Course 2007 by
Abhik Roychoudhury

Parameters, Local Vars

- Formal parameters of R1
 - All predicates in E_R which do not refer to local variables of R
- All other preds. in E_R are local vars. of R1.
- Natural notion of *input context* for R1.
- Example:
 - Concrete Parameters: q, y
 - Abstract Parameters: $y \geq 0, *q \leq y$

IISc Summer Course 2007 by
Abhik Roychoudhury

Return Variables

- Natural notion of *output context* for R1. Pass info. to callers about
 - Return value of R
 - Global Vars
 - Call-by-reference parameters ...
- Info. about return value captured by those preds in E_R which refer to return var. of R, but no *other* local variable (return var. can be a local var.)

IISc Summer Course 2007 by
Abhik Roychoudhury

Return Variables

- Info about global var/reference parameters
 - Preds. in E_R which were computed to be formal parameters of R1, **AND**
 - Refer to global variables, dereferences
- $E_R = \{ y \geq 0, *q \leq y, y = l1, y > l2 \}$
 - Concrete ret. Var. : $l1$
 - Concrete Parameters: q, y
 - Abst. Ret. Vars: $y = l1, *q \leq y$

IISc Summer Course 2007 by
Abhik Roychoudhury

Control constructs

- Abstraction scheme will be developed for
 - Within a procedure
 - Assignments
 - Branches
 - All other constructs can be represented by these
 - Across procedures
 - Formal parameter, Local variables, Return variables
 - Procedure calls and returns**

IISc Summer Course 2007 by
Abhik Roychoudhury

Procedure Calls

- So far, abstraction of a single procedure
 - Assignments (with aliasing)
 - Branches (if-then-else, loops)
 - Formal Parameters
 - Local and global variables
 - Return variables
- Use input/output contexts in procedure call/return in inter-procedural abstraction.

IISc Summer Course 2007 by
Abhik Roychoudhury

Passing Parameters

- Take any formal parameter predicate b of $R1$

Void main() { ... r = procedure(p, x); }	int procedure(int *q, int y){ int l1, l2; ... return l1; }	All predicates of "procedure" : - y >= 0 -*q <= y -y = l1 -y > l2
	Formal parameter preds. of procedure -y >= 0 -*q <= y	

IISc Summer Course 2007 by
Abhik Roychoudhury

Passing Parameters

- Replace formals by actuals in b .
 - $y \geq 0$ is a formal parameter pred.
 - After replacement, it becomes $x \geq 0$
- If $F(b[\text{formals} \rightarrow \text{actuals}])$ holds during procedure invocation of the boolean pgm, then pass *true* to the parameter b
- If $F(\neg b[\text{formals} \rightarrow \text{actuals}])$ holds, then pass *false* to parameter b
- Otherwise, pass *unknown*.

IISc Summer Course 2007 by
Abhik Roychoudhury

Exercise

- Work out the **boolean expressions** passed to the two parameters of *procedure* in our example shown before
- Use the definition of the F operator given earlier and the abst. predicates given.

IISc Summer Course 2007 by
Abhik Roychoudhury

Procedure Returns

- If procedure S calls procedure R , and
 - $S1/R1$ are abstractions of S/R
 - $b1, \dots, bj$ are abstract ret. Vars of $R1$
- Then $S1$ has j corresponding local boolean vars. which will be updated by call to $R1$.
- Do the local preds. in S need to be updated ? **YES**

IISc Summer Course 2007 by
Abhik Roychoudhury

Procedure returns

- These local preds. of S can refer to
 - Concrete Return var. for R
 - Global Vars (along with other local vars)
- For each such pred b , again compute $F(b)$ and $F(\neg b)$ to decide the value of b .
- The function F is computed w.r.t
 - Set of abstraction preds (under the carpet ☺)

IISc Summer Course 2007 by
Abhik Roychoudhury

Procedure returns

- To compute the effect of return from R into S (calling procedure), compute F w.r.t.
 - Return predicates of R
 - (Capture effect on global vars/return vars/ref.)
 - Predicates of S which do not need to be updated.
- An implicit partitioning of the preds of S !!
- Self Study: This portion in the reading.**

IISc Summer Course 2007 by
Abhik Roychoudhury

Reading(s)

- *Automatic Predicate Abstraction of C Programs*
 - Ball, Majumdar, Millstein, Rajamani
 - PLDI 2001.
- Also useful: *Polymorphic Predicate Abstraction*
 - MSR Tech Rep. by same set of authors.

IISc Summer Course 2007 by
Abhik Roychoudhury

Reading Exercise

- Currently, the predicates used for abstraction can only contain program variables. Is this a restriction ?
 - What about values returned by procedures and/or passed by parameters ?
 - Can we track such values by introducing new names ? We can have preds like
 - `Ret_value_of_v = Passed_value_of_v + 1`

IISc Summer Course 2007 by
Abhik Roychoudhury
